

Read me file for Inter Process Communication

We have created a structure which stores an arrays of 5 string and an array of their indexes. We have created 10 structs and are sending them using IPC methods

1. In first part we have used FIFO to communicate between two processes. We have create a FIFO by the name of "ipc" in our Makefile.
2. In second part we have used unix domain socket to communicate between two process. We have created a socket by the name of my_socket to communicate between two process.
3. In third part we are using shared memory to communicate between two process. We created memory segment by the name of data_segment.
