

Read me file for Kernel Module

1. This program / module reads the entries of the process `task_struct` corresponding to any given process (supplied as input via command line argument) and prints the values of the following field: Process ID, user id, process group id (pgid) and command path.
2. `task_struct` stores state of the process when it is pre-emptive along with it's PID and register's value.
3. We are using kernal commands to print all the details.
